

ABSTRACT OF THE DISCLOSURE

The present invention relates to an apparatus for metering and dispensing powdered product into containers, including a storage chamber for receiving the product, an incrementally rotating filler wheel that has at least one metering opening, the filler wheel in a first position receiving product from the storage chamber and in a second position dispensing the received product to a container, and a closure element, which is disposed adjacent to the filler wheel and can be connected to the filler wheel in such a way that upon a motion of the filler wheel into its replacement position, the closure element is disposed below the storage chamber, to prevent the escape of product from the storage chamber.
